Police Force Analytics Dashboard Summary

Dashboard Purpose

The core purpose of this interactive Power BI dashboard is to transition raw, regional crime data into a unified, self-service operational intelligence tool. It empowers police leadership teams to dynamically monitor volume fluctuations, evaluate peer-force performance on a population-normalised basis, identify localised geographic clusters, and make evidence-based resource allocation decisions without requiring technical supervision

Intended Audience

The intended audience is the senior members of the chosen police forces (Metropolitan, Surrey, Thames Valley, Sussex). With this in mind, the dashboard was catered for use by this audience to ensure that when in their possession, they can navigate the dashboard without supervision and make decisions based on analysis.

Key Assumptions and Limitations

To analyse seasonal crime trends, raw crime entries were grouped into calendar quarters using the following logic:

Quarter	Months
Quarter 1	January, February, March
Quarter 2	April, May, June
Quarter 3	July, August, September
Quarter 4	October, November, December

- As the crime data is derived from 2019-2024, historical changes in police strategy and these outcomes cannot be analysed, as well as the inability to observe long-term trends in crime
- The dashboard also lacks qualitative context, such as why these crimes happened and police response times, and is instead restricted to quantitative metrics
